

rintrinio

Team Andrey Markov

Introduction to rintrinio

The purpose of rintrinio is to take the data from Intrinio (Swagger Codegen community 2020) and make it extraordinarily easy to move to a format for analysis in R (R Core Team 2019).

This document introduces you to the functions included in this package.

Functions

The four functions in the package are as follows:

- `gather_financial_statement_time_series()` to compare a single company's financial statements over time
- `gather_financial_statement_company_compare()` to compare multiple company's financial statements in a single period
- `gather_stock_time_series()` to gather a time series of stock price information
- `gather_stock_returns()` to gather returns of stocks over time

Time Series Financial Statement Analysis with `gather_financial_statement_time_series()`

`gather_financial_statement_time_series()` takes in information that would be spread across multiple lines when querying the Intrinio API directly, and puts it into a function that by default returns a dataframe that is ready to be used for analysis. This function should be used for time series analysis of financial statements (income statement, balance sheet, or cash flow statement).

For example, we can compare Apple's 2018 and 2019 Q1 Balance Sheet:

```
fs_ts <- gather_financial_statement_time_series(api_key = api_key,
                                                ticker = 'AAPL',
                                                statement = 'balance_sheet_statement',
                                                year = c("2018", "2019"),
                                                period = c('Q1'))

knitr::kable(fs_ts)
```

type	fin_value	fin_value.
ticker	AAPL	AAPL
statement	balance_sheet_statement	balance_sheet_statement
year	2018	2019
period	Q1	Q1

Cross-Company Financial Statement Analysis with `gather_financial_statement_company_compare()`

`gather_financial_statement_company_compare()` takes in information that would be spread across multiple lines when querying the Intrinio API directly, and puts it into a function that by default returns a dataframe that is ready to be used for analysis. This function should be used for cross-company analysis of financial statements (income statement, balance sheet, or cash flow statement).

For example, we can compare Apple and Cisco's Income Statement results for Q1 of 2019:

```
fs_compare <- gather_financial_statement_company_compare(api_key = api_key,
                                                         ticker = c("AAPL", "CSCO"),
                                                         statement = "income_statement",
                                                         year = "2019",
                                                         period = "Q1")

knitr::kable(fs_compare)
```

name	value.x	value.y
ticker	AAPL	CSCO

Time Series Stock Analysis with `gather_stock_time_series()`

`gather_stock_time_series()` is a function for simplifying time series analysis of stock prices of a single company. It takes in the ticker, start and end dates (optional), and an Intrinio API key, and returns a dataframe that can easily be plotted to view trend analysis, or analysed as is.

For example, we can see how Cisco's close price changed over 2019 and model it with ggplot (Wickham 2016):

```
stock_data <- gather_stock_time_series(api_key = api_key,
                                       ticker = "CSCO",
                                       start_date = "2019-01-01",
                                       end_date = "2019-12-31",
                                       allow_max_rows = TRUE)

ggplot(stock_data, aes(x = date, y = close)) +
  geom_line() +
  ggtitle("Cisco Close Prices over 2019") +
  labs(x = "Time", y = "Close Price")
```

Cisco Close Prices over 2019

Understand Stock Returns with `gather_stock_returns()`

`gather_stock_returns()` allows for a combination of looking at time series stock data and comparing returns across companies. This function allows effortless comparisons of returns across companies given a buy date and a sell date. Historical analysis is important for portfolio evaluations and comparisons.

For example, we can compare Apple and Cisco's returns over Q1 2019:

```
stock_returns <- gather_stock_returns(api_key = api_key,
  ticker = c("AAPL", "CSCO"),
  buy_date = "2019-01-01",
  sell_date = "2019-03-31")

knitr::kable(stock_returns)
```

Stock	Buy.date	Buy.price	Sell.date	Sell.price	Return. . .
AAPL	2019-01-02	155.2140	2019-03-29	187.4959	20.80
CSCO	2019-01-02	41.4651	2019-03-29	52.5269	26.68

Comparisons

`rintrinio` does not add any new capabilities to what exists in the tidyverse (Wickham 2017) and from Intrinio's API (Swagger Codegen community 2020), but each function consolidates at least 10 lines of code into a more

readable and user-friendly format.
